

ABSTRACT

A shower device includes a conduit having a bore to slidably receive a lower portion of a tube, and to allow the tube to be adjusted up and down relative to the conduit. A shower head is
5 attached to the tube and moved up and down together with the tube, and a control ferrule is attached to the conduit and the tube, and includes two or more sealing rings to make water tight seals between the conduit and the control ferrule, and between the tube and the control ferrule. The tube may be secured to a supporting
10 surface with a bracket.
